

Welcome to country

I'd like to begin by acknowledging the Traditional Owners of the land on which we meet today, the Gadigal people of the Eora nation and pay my respects to Elders past and present.

They are the first engineers, teachers and learners on these lands.

Agenda				
1	Introduction & housekeeping	6	Online Examinations Discussion	
2	Making VS Code work for you	7	Practical software security activities	
3	Morning tea	8	GitHub and Flask	
4	Overview of Python Flask	9	Cyber security presentation	
5	Practical software security activities	10	Evaluation and close	
				4

Day Overview A practical approach to 'Secure Software Architecture' in Software Engineering A practical and hands-on day in a small group, supportive environment for teachers to build their confidence, skills and tools to deliver the NESA Software Engineering course. Focusing on the 2 focus areas 'Secure Software Architecture' and 'Programming for the Web'. The skills and tools can also be directly applied to supporting students with the design and development of their 'Software Engineering Project' or easily creating a user interface for 'Software Automation'.

	1
Need to know	
We are in room 8.05 on level 8	
Toilets are We are in a respectful adult learning environment	
Please be present (as we would say to the students, 'phones {emails} are off and away'). If a mobile call is essential, please take it outside.	
Please respect all presenters and their time commitment today.	
This session is designed for beginners. All questions are welcome and encouraged.

Learning intentions and success criteria	
We are learning to:	
Understand how Extensions can enhance VSCode IDE capabilities Setup VSCode as a general-purpose IDE for Software Engineering	
Create profiles so we can quickly change our environment for different contexts	
We can: Understand the benefits and limitations of extensions	
Import a profile Customise the IDE to suit our needs	
Customise the LDE to suit our needs Create a profile	

Making VS Code work for you

Vhy VSCode

Wide industry use, 2nd most used IDE (15%) behind Visual Studio (25%)

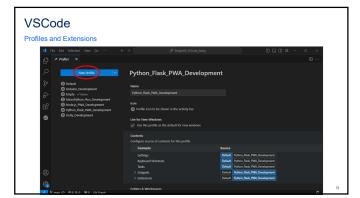

A simple IDE with all the capabilities for the Software Engineering course

High extensible through extensions, settings and profiles

Formatting, linting, debugging, terminal, Al and version control integrated

10

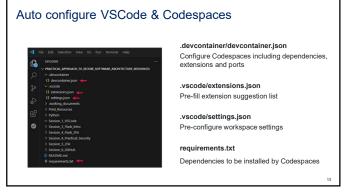

11

Essential Python Extensions

Enhance your development experience

- Debugging set breakpoints, step through code, inspect variables, and perform other essential debugging tasks. Python Debugger
- Linting basic static code analyser PyLint
- Formatting a tool that helps you improve the readability and maintainability of your code. Prettier (HTML, CSS, JS, JSON, etc) Black Formatter (Python)
- Code support a tool that provides performant language support. Pylance
- Visual tools a range of tools that visually improve the IDE or the readability of code. Indent Rainbow, Rainbow CSV, etc
- IDE Functionality a variety of tools that make the IDE more functional. SQLite3 editor, Thunder Client, etc
- https://github.com/TempeHS/TempeHS_VSCode_Setup

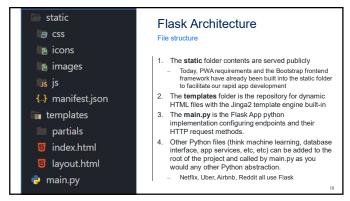

Install Requirements For Today The easy way... \$ pip install -r requirements.txt

14

GitHub Codespaces VSCode in the cloud Demonstration of Codespaces: https://github.com/features/codespaces GitHub Education: https://github.com/education

Learning intentions and success criteria We are learning to: Create a Flask application We can: Understand the Flask architecture Apply the architecture to create a basic Flask application with endpoints Understand the fundamentals of the Jinga2 template engine in Flask

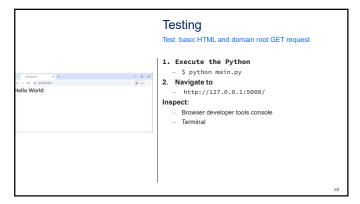

Flask Install	
\$ pip install flask	
	19

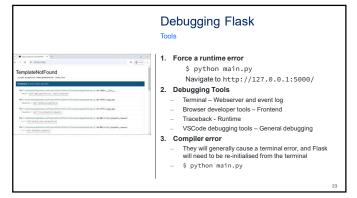

```
# Import dependencies
from flask import Flask
from flask import render_template
from flask import request

# Create an instance of the Flask class in the app variable
app = Flask(_name__)

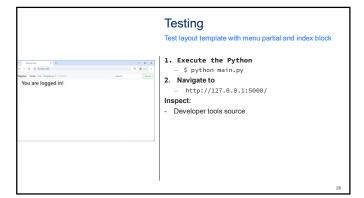

# Define the route for the index page at domain root
@app.route("/", methods=["POST", "GET"])
def index_page():
    return render_template("index.html"), 200

# Initialize the Flask application
if __name__ = "__main__":
    app.run(debug=True)
```

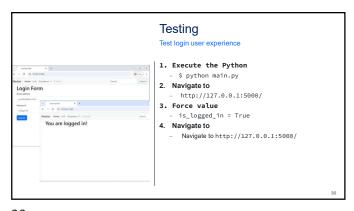

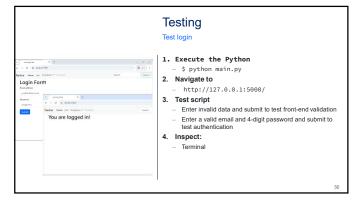

```
1 is_logged_in = False
2
3 @app.route("/", methods=["POST", "GET"])
4 def index_page():
5     global is_logged_in
6     return render_template("index.html", is_logged_in=is_logged_in), 200
```

```
| Compared to the control of the con
```

```
def index_page():
    global is_logged_in
    if request.method = "POST":
        email = request.form["email"]
        password = request.form["password"]
        is_logged_in = True
        app.logger.critical(f"{email} is logged in ? {is_logged_in}")
    return render_template("index.html", is_logged_in=is_logged_in), 200
```

32

```
1 def index_page():
2    global is_logged_in
3    if request.method = "POST":
4        if request.form["password"].isdigit():
5         password = int(request.form["password"])
6         email = request.form["email"]
7         is_logged_in = db_manager.check_login(email, password)
8         app.logger.critical(f"{email} is logged in ? {is_logged_in}")
9         return render_template("index.html", is_logged_in=is_logged_in), 200
```

```
1 from flask import current_app
2 import sqlite3 as sql

4

5 def check_login(email, password):
6 con = sql.connect(".database_files/database.db")
7 cur = con.cursor()
8 cur.execute(
9 "SELECT * FROM TLD91_USERS WHERE email = ? AND password = ?",
10 (email, password),
11 )
12 result = cur.fetchone()
13 con.close()
14 if result is None:
15 return False
16 else:
17 return True
```

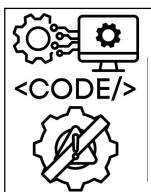

Learning intentions and success criteria

We are learning to:

- Develop knowledge of the architecture of vulnerabilities listed in the syllabus
- Deconstruct the code that enables the vulnerabilities listed in the syllabus
- Identify countermeasures to the vulnerabilities listed in the syllabus

- Describe the architecture, code and countermeasures of vulnerabilities listed in the syllabus
- Use the structure to explicitly teach our students

37

Architecture, Code & Countermeasure

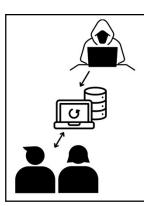

Understanding the vulnerability

Architecture: What is the structure of the vulnerability, including the people involved?

Code: At the code level, what does the exploit or vector look like, and what code patterns enable the vulnerability?

Countermeasure: What can be done to reduce the likelihood of the exploit or vector?

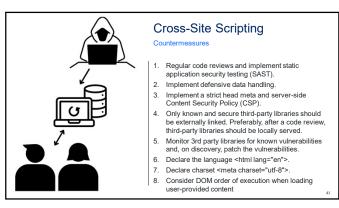

38

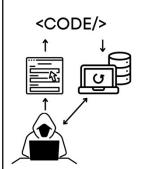

Cross-Site Scripting XXS

- 1. A threat actor inserts a malicious script into a website by:
- SQL injection into a known database structure that forces script into head HTML.
- JS injection into form with insufficient defensive data handling
 Hijacked library, plugin or extension
- Sharing a hyperlink with a script attached or redirect to a hyperlink and script
 The victim visits the website, and the script is executed.
- 3. The malicious script may: Downloads a more malicious program
- Change the use interface or experience POST data from the UI to another website

```
Cross-Site Scripting XXS
```

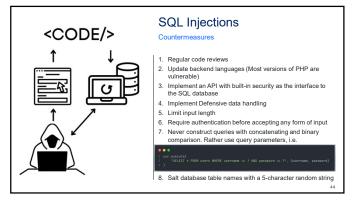

41

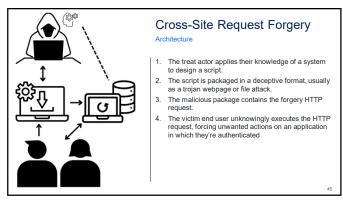

SQL Injections

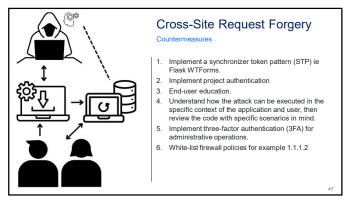

- 1. The threat actor constructs form inputs that are SQL commands and variables to control the application.
- 2. By the user controlling the inputs, they can:
- Force an equality check to return true to gain access to authenticate or escalate authority.
- Destabilise an application by dropping a table.
- If the table structure is known or obvious (users,
- wp_posts, etc), insert malicious content that will be loaded into a session by all users.

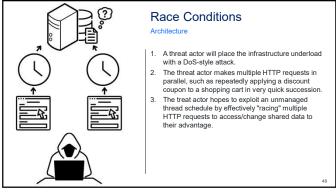

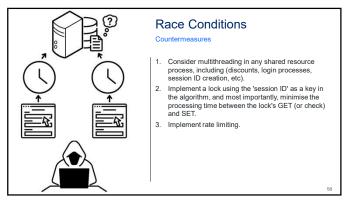

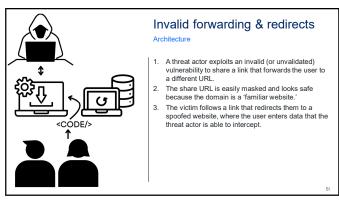

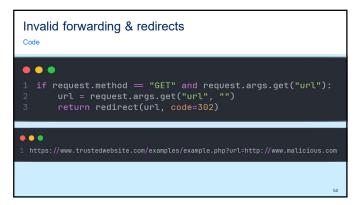

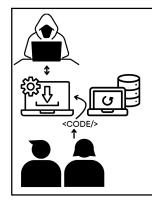

Invalid forwarding & redirects

Countermeasures

- 1. Code review
- Explicitly declare the protocol, subdomain and domain as a minimum in the backend code and do not allow URLS to be manipulated by input.
- 3. Validate inputs, if a form requires URL's use regular expressions to explicitly define the URL specifications (HTTPS, subdomains, domains, paths and endpoints were possible) and exclusions (>, <, ?, etc). This is particularly important if the input will be rendered on the front end or processed in the backend.
- Update backend languages (early versions of asp.net are vulnerable)

53

53

Side Channel Attack

Architecture

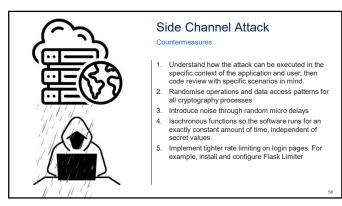

A side-channel attack is any attack based on extra information that can be gathered because of the fundamental way a computer protocol or algorithm is implemented.

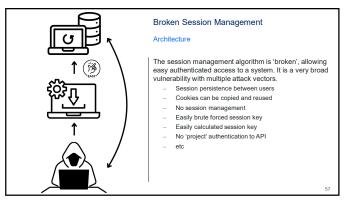

Leaking data includes:

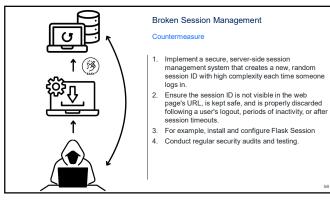

- 1. Time
- 2. Cache
- 3. Power/electromagnetic/thermal energy, etc
- 4. Frequency outputs
- 5. Exception response
- 6. Error response

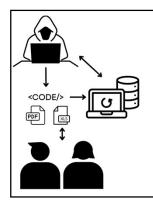

E4

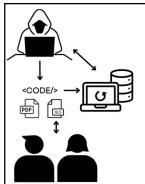

File Attack

- . A file (usually an Excel Macro *.xlsm or a PDF with Javascript) is either sent to a user or placed on a honeypot website and downloaded by a user.
- The file is open, and the malicious script (Javascript, Visual Basic, Python, etc.) is executed on open or when an action is performed in the document.
- 3. The malicious code could:
 - Install a more malicious program (key logger, screen sharing, etc)

 - Change DNS settings
 POST data from active website UI to another website
 - Steel cookies or session data
 - Perform state-changing processes on install systems

59

File Attack

- 1. Countermeasure common vulnerabilities
 - Cross Frame Scripting XFS Cross Site Request Forgery - CSRF
 - Cross Site Scripting XSS
 - Broken Authentication and Session Management.
- 2. Implement Two Factor Authentication 2FA.
- 3. End user education
- 4. White-list firewalls
- 5. Application control policies

Learning intentions and success criteria

Session 4 – Implementing 2FA

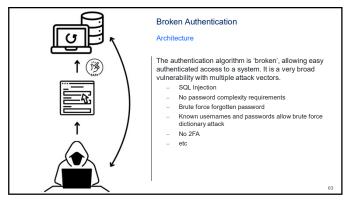

We are learning to:

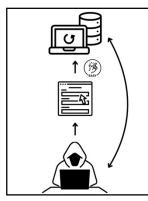

- implement code that considers security factors
- implement secure code that minimises vulnerabilities in user action controls including broken authentication

We can

- Mitigate against broken authentication and session management
- Implement code for defensive data input handling practices

62

Broken Authentication

- 1. Enforce strong passwords.
- 2. Event logging and log analysis.
 3. Implement a secure, server-side session management system that creates a new, random session ID with high complexity each time someone logs in. For example, install and configure Flask Session

 A longement two frace subscriptions.
- 4. Implement two-factor authentication.
- 5. Conduct regular security audits and testing.
- Implement strong rate limiting for a login page. For example, install and configure Flask Limiter.
- Salt and hash passwords.

64

Implementing 2FA

QR Code + Google Authenticator + Flask

Requirements:

 Device with Google Authenticator (tablet or smartphone)

65

Implementing 2FA

QR Code + Google Authenticator + Flask

Requirements:

- Pyotp is a Python library for generating and verifying one-time passwords. It can be used to implement two-factor (2FA) or multi-factor (MFA) authentication methods in web applications and in other systems that require users to log in.

Implementing 2FA

QR Code + Google Authenticator + Flask

- os provides functions for interacting with the operating system.
- base64 used to encode strings in Python
- BytesIO used to manage and deal with Unicode characters

Note:

Every time you compile and run the code you need to update the QRCode image (within the app) and rescan the QRCode in the app

67

Implementing 2FA

QR Code + Google Authenticator + Flask

Alternatives

• Email (Twilio)

Implementing in Visual Studio Code

Adding 2FA to the PWAwe have created so far.

68

Adding in the additional imports required for the QRCode functionality.

Line 19: We also need to add a secret key which is used in the generation of the QRCode.

69

```
Implementing 2FA: OR Code + Google Authenticator + Flask

### Obsproate( /emable 2fa. httl , methods=['GET', 'POST'])

### of the state of the state
```

GitHub

Demo

- Code hosting
- Version controlCollaboration tools
- Static web hosting
- Codespaces VSCode in the cloud
- Student portfolios
- Static application security testing
